                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ş
The invention relates to an isolated nuclei acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins
                                                                                                          New isolated nucleic agenes from Drosophila interactions
                                                                                                                                                                                                                                  23-MAR-2000;

                                                                                                                                                                                                                                This invention describes novel purified human soluble guanylate cyclase alphal/betal (hsGCalphal/betal). The products of the invention have antiarteriosclerotic, vasotropic and hypotensive activity. Nucleic acid sequences encoding the alphal and/or betal subunit are useful for somati gene therapy of arteriosclerosis and restenosis, ischemia (infarct), peripheral arterial occlusive disease and arterial hypertension.

Antibodies to hsGCalphal/betal can be used for diagnosis of aberrant hsGCalphal/betal expression in human tissues. This sequence represents the human soluble guanylylcyclase alphal subunit described in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human: guanylylcyclase alphal; hsGCalphal; hsGCbetal; soluble; guanylylcyclase betal; antiarteriosclerotic; vasotropic; hypotensive; gene therapy; arteriosclerosis; restenosis; ischemia; diagnosis; peripheral arterial occlusive disease; arterial hypertension.
                                                                                                                                                                                                                                                                                                                                                                                               New human soluble guanylate cyclase alphal/betal and the nucleic avenceding the subunits, useful for producing diagnostic antibodies, for somatic gene therapy of arteriosclerosis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DE19837015-A1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        prostate cancer associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancer associated polynucleotide sequences are differentially expressed in prostate tumour tissue of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer associated genes are useful for diagnosing or treating prostate cancer. The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications.

ABG61800-ABG61944 represent prostate cancer—associated proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to methods of detecting a prostate cancer-associated transcript in a cell from a patient. The meticomprises contacting a biological sample from the patient with

```
cancer-associated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with prostate cancer-associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer-associated genes are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            13-OCT-2000;

capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABS57737-ABB72072).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from prosophila. The invent: useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG176-BBL30511), expressed DNA sequences (ABLIG176-B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (ABB57737-ABB72072)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid genes from Drosophila and interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         N-PSDB;

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukarytes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL101840-ABL16175) and the encoded proteins

```
The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

```
CC (atrionatriuretic peptide receptor A) yearly acte by conserved (atrionatriuretic peptides receptor A) or NPRI polypeptide. A method for CC (atrionatriuretic peptide receptor A) or NPRI polypeptide. A method for CC nucleotide at one or more polymorphic sites and determining whether one CC of the copies of the gene is defined by one of the NPRI haplotypes given in the specification or whether both copies are defined by a haplotype copair. This method is useful in genotypha, whereby all possible haplotype can be assigned to specific genotypes. An association between a CC identified by comparing the frequency of the NPRI gene can be comparing the trait with the frequency of the haplotype pair in a reference population, where a higher haplotype cor haplotype pair the trait with the frequency of the haplotype cor frequency in the trait population indicates the trait is associated with the haplotype or haplotype pair. NPRI and its corresponding DNA are used CC for studying the expression and function of NPRI, for use in screening CC for studying the expression and function of NPRI, set in screening CC or candidate drugs to treat diseases related to NPRI activity, such as CC hypertension. The sequences are also useful for studying the effect of variation on the biological activity of NPRI as well as on the binding CC affinity of candidate drugs targeting NPRI. This sequence represents the Number of NPRI and the sequence represents the Number of NPRI and the sequence represents the Number of NPRI as well as on the binding can be number of NPRI as well as on the binding the Number of NPRI as well as on the binding can be number of NPRI as well as on the binding can be number of NPRI as well as on the binding can be number of NPRI as well as on the binding can be number of NPRI as well as on the binding can be number of NPRI as well as well as on the binding can be number of NPRI as well as well as well as well as well as well as well as well as well as well as well as well as well as well as well as well as well as we
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

Human proteins and DNA encoding sequences useful for preventing treating or ameliorating a medical condition in a mammalian subj .g. arthritis and subject

Claim 20; Page 246-247; 1963pp; English

haematopolesis regulatory activity: tissue growth activity:

immunomodulatory activity: activity: or inhibin-related activities;

chemotactic or chemokinetic activities; haemostatic, thrombotic or

thrombolytic activities; receptor or ligand activities; or may be

involved in oncogenesis, cancer cell proliferation or metastasis.

Depending on their biological activities, polypeptides and nucleotides of

the invention are useful for preventing, treating or ameliorating medical

conditions, e.g., by protein or gene therapy. Such conditions include

cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell

disorders), chronic inflammatory conditions (e.g., asthma or arthritis),

proliferative retinopathy, atherosclerosis, coronary heart disease,

arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal

vascular growth. Polypeptides involved with tissue regeneration and

repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incisions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders. Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known protesins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention methave various activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides Sequences ABB10981-ABB12330 represent 1350 novel invention. polypeptides, an cell

These proteins are enterotoxin receptors which may be used as a therapeutic to contintestinal fluid permeation as well as abnormal conditions caused by bacterially released enterotoxin. The binding domain of the proteins, or antibodies to the proteins, can be used to eliminate diarrhoea. The proteins may be used to isolate ligands and to scree for antagonists of toxin binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New purified enterotoxin receptor protein - used to develop prods. for treating abnormal conditions caused by bacterially released enterotoxin, partic. diarrhoea

A;Title: A new form of guanylyl cyclase is A;Reference number: A36228; MOID:91105012; A;Accession: A36228
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 4

OYRTB2

guanylate cyclase (EC~4:6.1.2), soluble, beta-2 chain - rat

guanylate cyclase; soluble, 76K chain

N;Alternate names: guanylate cyclase, soluble, 76K chain

C;Species: Rattus norvegicus (Norway rat)

C;Date: 31-Mar-1993 #sequence_revision 31-Mar-1993 #text_change
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A; Experimental source: kidney C; Superimental source: kidney c; Superfamily: soluble guanylate cyclase; guanylate cyclase catalytic C; Keywords: cGMP blosynthesis; heterodimer; phosphorus-oxygen lyase F; 360-584/Domain: guanylate cyclase catalytic domain homology <GCC>

guanylate cyclase (EC 4.6.1.2), soluble, alpha-1 chain - rat
N.Alternate names: guanylate cyclase, soluble, 77K chain
C;Species: Rattus norvegicus (Norway rat)
C;Date: 31-Mar-1993 #sequence_revision 31-Mar-1993 #text_change 18-Jun-1999
C;Accession: A38297
C;Accession: A38297

Database : SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

prenatally in the rat brain.";

Brain Res. Dev. Brain Res. 97.226-234(1996).

-I CATALYTIC ACTIVITY: GTP = 3',5'.cyclic GMP + diphosphate.
-I ENZYME REGULATION: ACTIVATED BY NITRIC OXIDE IN THE PRESEN
MAGNESIUM OR MANGANESE IONS.
-I SUBUNIT: HETERODIMER OF AN ALPHA AND A BETA CHAIN.
-I SUBCELLULAR LOCATION: Cytoplasmic.
-I MISCELLANEOUS: THERE ARE TWO TYPES OF GUANYLATE CYCLASES:
FORMS AND MEMBRANE-ASSOCIATED RECEPTOR FORMS.
-I SIMILARITY: BELONGS TO ADENYLYL CYCLASE CLASS-4/GUANYLYL CYCLASE
